2PDAM5) for solving nonlinear two point boundary value problems (BVPs) directly. The two step direct method will be utilised to obtain a series solution of the initial value problems at two steps simultaneously. These methods will solve the nonlinear second order BVPs by shooting technique using constant step size. Three step iterative method is considered as a procedure for solving the

Boundary value problems with positive solutions, i.e. solutions y satisfying $y(t) > 0$ for all $t \in (0, 1)$, describe many phenomena in the applied mathematical sciences found in the theory of nonlinear diffusion generated by

nonlinear sources, thermal ignition of gases, and concentration in chemical or biological problems.

Differential Equations - Boundary Value Problems

With boundary value problems we will have a differential equation and we will specify the function and/or derivatives at different points, which we'll call boundary values. For second order differential equations, which will be looking at pretty much exclusively here, any of the following can, and will, be used for boundary conditions.
